1 WASTE AND MATERIAL TRACKING

All waste and material collected during response activities associated with the MC 252 Oil Spill Incident are tracked and reported using a uniform system. For purposes of this plan, “wastes and materials” are defined as both liquid and solid wastes and materials. The tracking system covers the affected states where releases from the oil spill are directly impacting the waters or land of a specific state, which includes Texas, Louisiana, Mississippi, Alabama, and Florida. If it is determined that wastes are or will be managed in other states, the tracking system will be expanded to include those states, and the EPA and the relevant states will be notified of the change.

The system actively tracks each of the five waste and material streams indicated below that have been and are anticipated to be generated as part of the MC252 response efforts:

Definitions used in Waste Tracking and Reporting:

- Oily Liquid - Oil and water mixtures or emulsions (e.g., from skimming or oil recovery operations);
- Liquid - Primarily water that may have an oily sheen or contain minor amounts of free oil droplets (e.g., decanted water, storm water, decontamination water, treated water, etc.);
- Oily Solid - Oil-impacted solid materials that may include debris, vegetation, protective clothing, etc., collected during cleanup activities;
- Solid Waste - Non-oiled, solid materials that may include household-type garbage, debris, vegetation, protective clothing etc., collected during cleanup activities; and
- Recyclable Materials - Plastic, metal waste, etc.

The overall process flow for managing the wastes and materials is illustrated in Figure 1.1.

**Figure 1.1 Waste/Material Management Flow**

Generation Location or Retrieval Activity	Waste/Material Type	Verification / Manifesting	Transport	Quantity and Quality?	Disposition
Operations Staging Areas	Solid Wastes	On-site consolidation, transfer to waste staging area for further consolidation and manifesting	Roll-off box	Generally not sufficient quantity of uniform material to be considered for recycling	Approved landfill
Vessels of Opportunity Deployment Locations	Solid Wastes Oily Solids	On-site consolidation, transfer to waste staging area for further consolidation and manifesting	Roll-off box	Generally not sufficient quantity of uniform material to be considered for recycling	Approved landfill
On-Shore Decontamination Stations	Solid Wastes Oily Solids Liquids Oily Liquids	On-site consolidation, transfer to waste staging area for further consolidation and manifesting	Roll-off box (solids) Vacuum truck (liquids)	Generally not sufficient quantity of uniform material to be considered for recycling	Approved landfill (solids) Approved treatment or disposal facility (liquids); water is separated, treated and discharged via POTW
Shore-line Cleanup Operations	Solid Wastes Oily Solids	On-site consolidation and manifesting, or transfer to waste staging area for further consolidation and manifesting	Roll-off box	Oily solids that are uniform and have sufficient quantity of oil for recovery are sent for recycling	Approved landfill (solids); oily solids may be segregated for potential future recovery efforts
Skimming Operations	Oily Solids Liquids Oily Liquids	On-site consolidation, transfer to waste staging area for further consolidation and manifesting	Barge or vessel	Materials that are uniform and have sufficient quantity of oil for recovery are sent for recycling	Approved landfill (solids) Approved recycling facility; oily solids (e.g., sorbent boom) may be centrifuged and separated oil sent for recycling

The system for tracking each of the waste and material streams travel that are generated / collected, consolidated, manifested, and transported for recycling or disposal follows the management process and is illustrated in Figures 1.2 and 1.3, and summarized as follows:

- Non-oil impacted and oil-impacted wastes and materials collected from response activities (e.g., non-reusable oily booms, oily debris from beach cleaning operations, waste water from decontamination stations, etc.) are sent to a temporary staging area or transferred directly to a recycling or disposal facility;
- The wastes and materials are manifested from the staging area, decontamination station, port/dock to an approved recycling/disposal facility. Approved facilities are listed in Table 1.1. Table 1.2 presents the list of current staging areas;
- Information on the manifests is recorded for each location and entered into a database that tracks the staging area, decontamination station, recycling and disposal facilities for each shipment (roll-off box, vacuum truck, barge, etc.);
- After the final disposition of each shipment is established, the manifest is reviewed and verified, and the verified data (e.g., weights, locations, and quantities) are confirmed in the database (a scanned copy of the manifest is obtained for future reference);
- The verified data are then posted in a summary table that presents quantities by location and waste profile identification number, and then presents cumulative amounts;
- Cumulative waste data are reported daily by waste type on the ICS-209 Form.

Figure 1.2 Process Flow

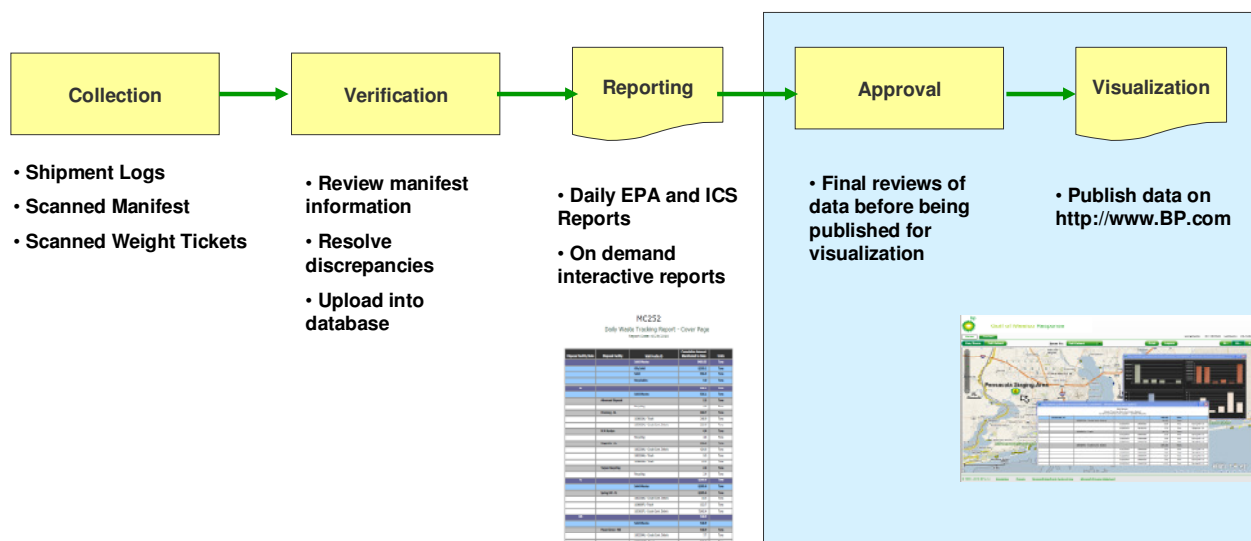

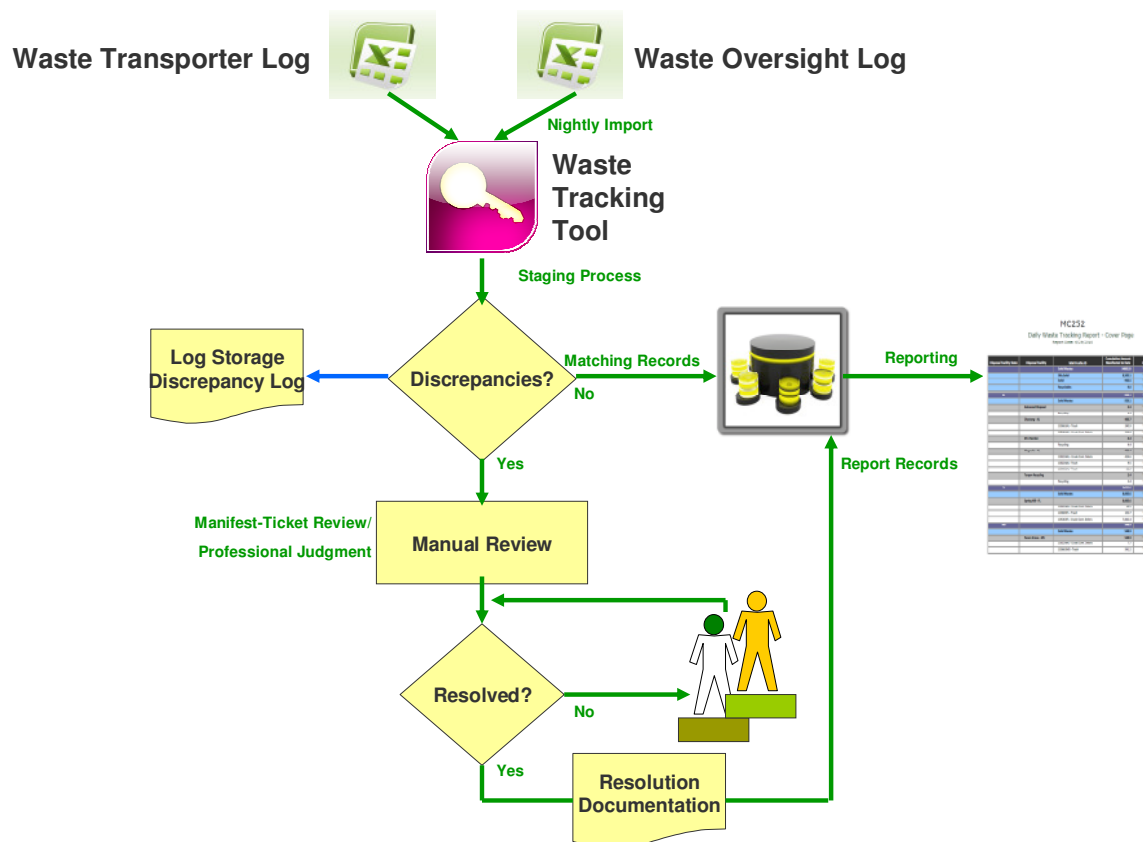

Figure 1.3 Verification Process

Recyclables are also tracked and documented on a routine basis. The approved disposal facilities are presented in Table 1.1. Waste Staging Areas are presented in Table 1.2.

*Others TBD as needed	

2 WASTE AND MATERIAL REPORTING

Figure 2.1 shows an example of the waste tracking database input and output summary table. These data are reported and posted daily on BP's public website. These are the same data that are presented in the ICS-209 forms for the Houma and Mobile Sectors in one combined report.

An example of the waste tracking summary information that will be posted weekly on BP's public website is provided in Figures 2.2a and 2.2b. This report presents summaries of waste quantities (in tons for solids and barrels for liquids) that are managed at each staging area and that are transported to the recycling or disposal facilities.

Figure 2.1 Consolidated Daily Reports

MC 252 Waste and Oil Recovery and Disposal -- Cumulative Total to Date				
Period Ending 19 Jul 2010				
	Mobile Sector	Houma Sector	Total	Units
Oily Liquid ⁽²⁾⁽³⁾	1,498.0	142,495.0	143,993.0	BBLs
Liquid ⁽²⁾	16,942.0	21,465.0	38,407.0	BBLs
Oily Solid ⁽²⁾	21,688.3	10,142.1 ⁽¹⁾	31,830.4	Tons
Solid Waste	1,926.2	1,447.6 ⁽¹⁾	3,373.8	Tons
Recyclable Materials	24.0	15.0 ⁽¹⁾	39.0	Tons

Notes:

1. Houma tonnages were converted from a volume basis and assumed a density conversion. Actual weights will be included in the future.
2. Material that has been manifested to a recovery facility or a disposal facility.
3. Through June 30th, approximately 8,400 BBL of oil have been reclaimed from Oily Liquid.

Definitions used in Waste Tracking and Reporting

Oily Liquid - Oil and water mixtures or emulsions (e.g., from skimming or oil recovery operations)

Liquid - Primarily water that may have an oily sheen or contain minor amounts of free oil droplets (e.g., decanted water, storm water, decontamination water, treated water, etc.)

Oily Solid - Oil-impacted solid materials that may include debris, vegetation, protective clothing, etc., collected during cleanup activities

Solid Waste - Non-oiled, solid materials that may include household-type garbage, debris, vegetation, protective clothing etc., collected during cleanup activities

Recyclable Materials - Plastic, metal waste, etc.
